

INVICTUS
INCIDENT RESPONSE

Incident Response Automation in AWS

Amsterdam 2022 FIRST Technical Colloquium
Korstiaan Stam, Founder Invictus Incident Response

Agenda

- 01 Introduction & Background**
Short introduction and background on AWS Incident Response automation
- 02 Approach**
Scope of the research and the methods used in the research
- 03 Invictus-AWS**
The reveal of the script developed that enables AWS Incident Response automation
- 04 Analysis phase**
Performing analysis on the collected data
- 05 Future**
What's next and how can we improve the current solution?

About Me

Professional

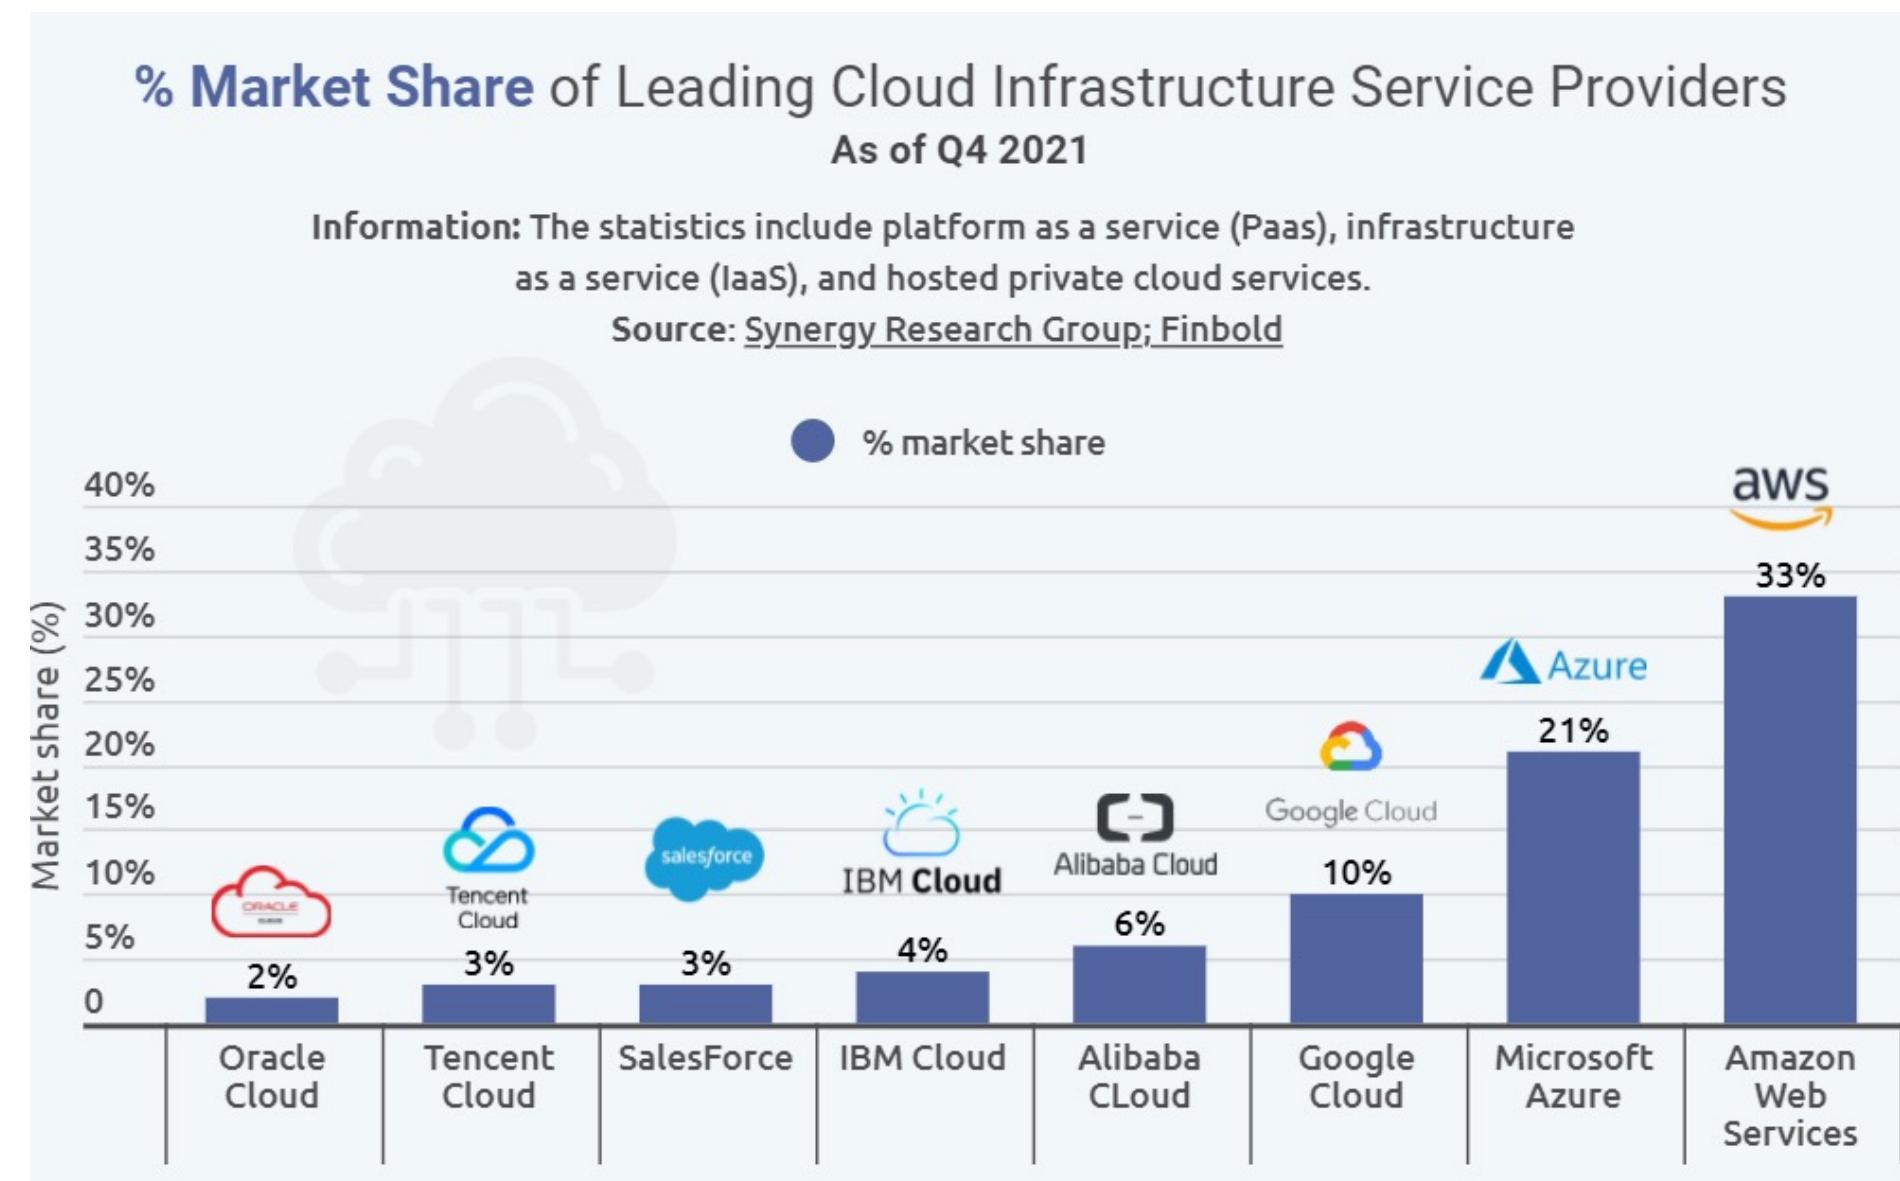

- Started my own IR firm in 2021
- Worked at PwC and led the IR team before that a cyber security specialist at Northwave
- Instructor in development at SANS
- Part-time cyber security lecturer in Amsterdam

Personal

- Like to learn new stuff and keep myself busy
- Try to blog and do some more CTFs

1 Introduction AWS Incident Response

AWS market leader

As an incident response firm or incident responder, we need to be able to quickly deploy in a client environment get an idea of what we're looking at to help our clients.

This is the main reason for our research and the talk today!

Introduction

Current state of AWS Incident Response

Organizations are not ready

Based on personal experience and talking with colleagues in the same field a lot of organizations that use cloud for their operations are not ready for incidents. Especially around forensic readiness and asset inventory.

Automation is slowly coming

Solutions to help you (automatically) acquire and investigate cloud data are slowly coming. Lots of public resources, scripts and blogs available showing the need for technology in the field.

An opportunity to do better

I strongly believe that the cloud offers an opportunity for defenders to do security better. With the shared responsibility model, you can identify where efforts and investments must be made. E.g., don't need to have datacenter security or hardware security anymore.

Field is not mature yet

The field of AWS/Cloud incident response is not very mature yet. However, through training, certifications and many organizations moving to the cloud the field will mature over time. Also compared to on-premise hosting the field is still young.

Introduction

The challenge

Many, many services

Every AWS deployment is different, there are so many services clients can use.

Currently over 200 different services in AWS!

Logs

AWS logs a lot, and every service can have their own logging. We need to identify quickly what's available and useful for our investigation.

Enumeration

It's a challenge to enumerate all services quickly to understand what services the client uses.

Complexity

AWS can become complex quickly, regions, permissions. You don't want to spend too much time in the beginning of your investigation to understand the environment.

2 Approach Security Research

We decided to invest time and resources in investigating how we can automate parts of the research. Together with two brilliant students from the UvA we developed a method to automate parts of the incident response process in AWS. The goal is to use native AWS solutions to automate parts of the IR process in AWS.

Antonio Macovei

<https://www.linkedin.com/in/antonio-macovei/>

Rares Bratean

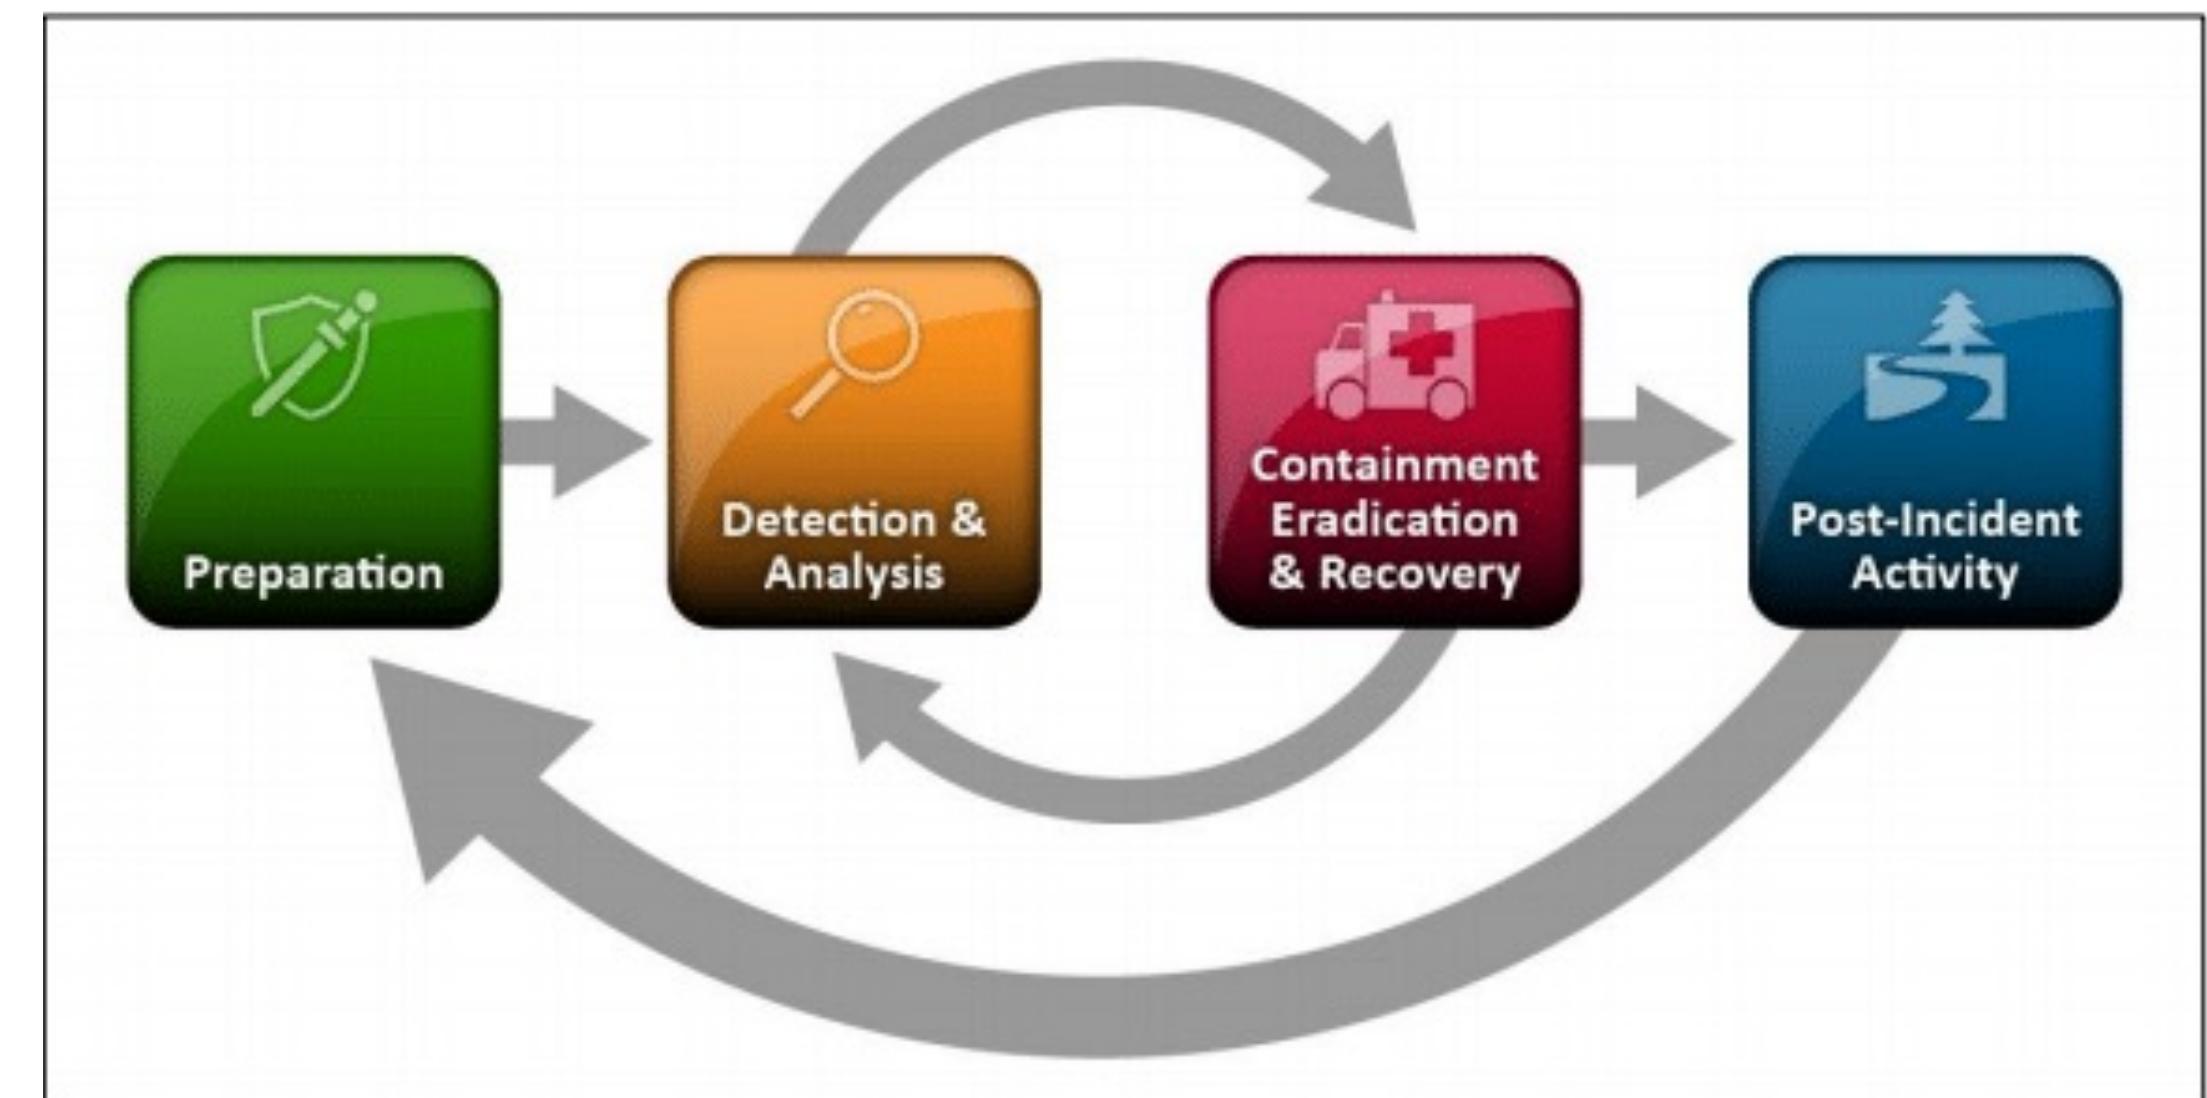

<https://www.linkedin.com/in/raresbratean/>

Without their work this wouldn't have been possible.

2 Approach NIST Incident Handling

Activities

1. Gather evidence
2. Analyse evidence to contain and eradicate the incident
3. Recover from the incident
4. Conduct post-incident activities, including post-mortem and feedback processes

This talk is mostly on automating Phase 1, with some examples and ideas for Phase 2.

Invictus-AWS

Overview

Stand alone Python script

- Uses 'aws' commands and 'boto'
- Free to use under license available
- Available as of today ☺ on <https://github.com/invictus-ir/Invictus-AWS>
- Suggestions and improvements are welcome

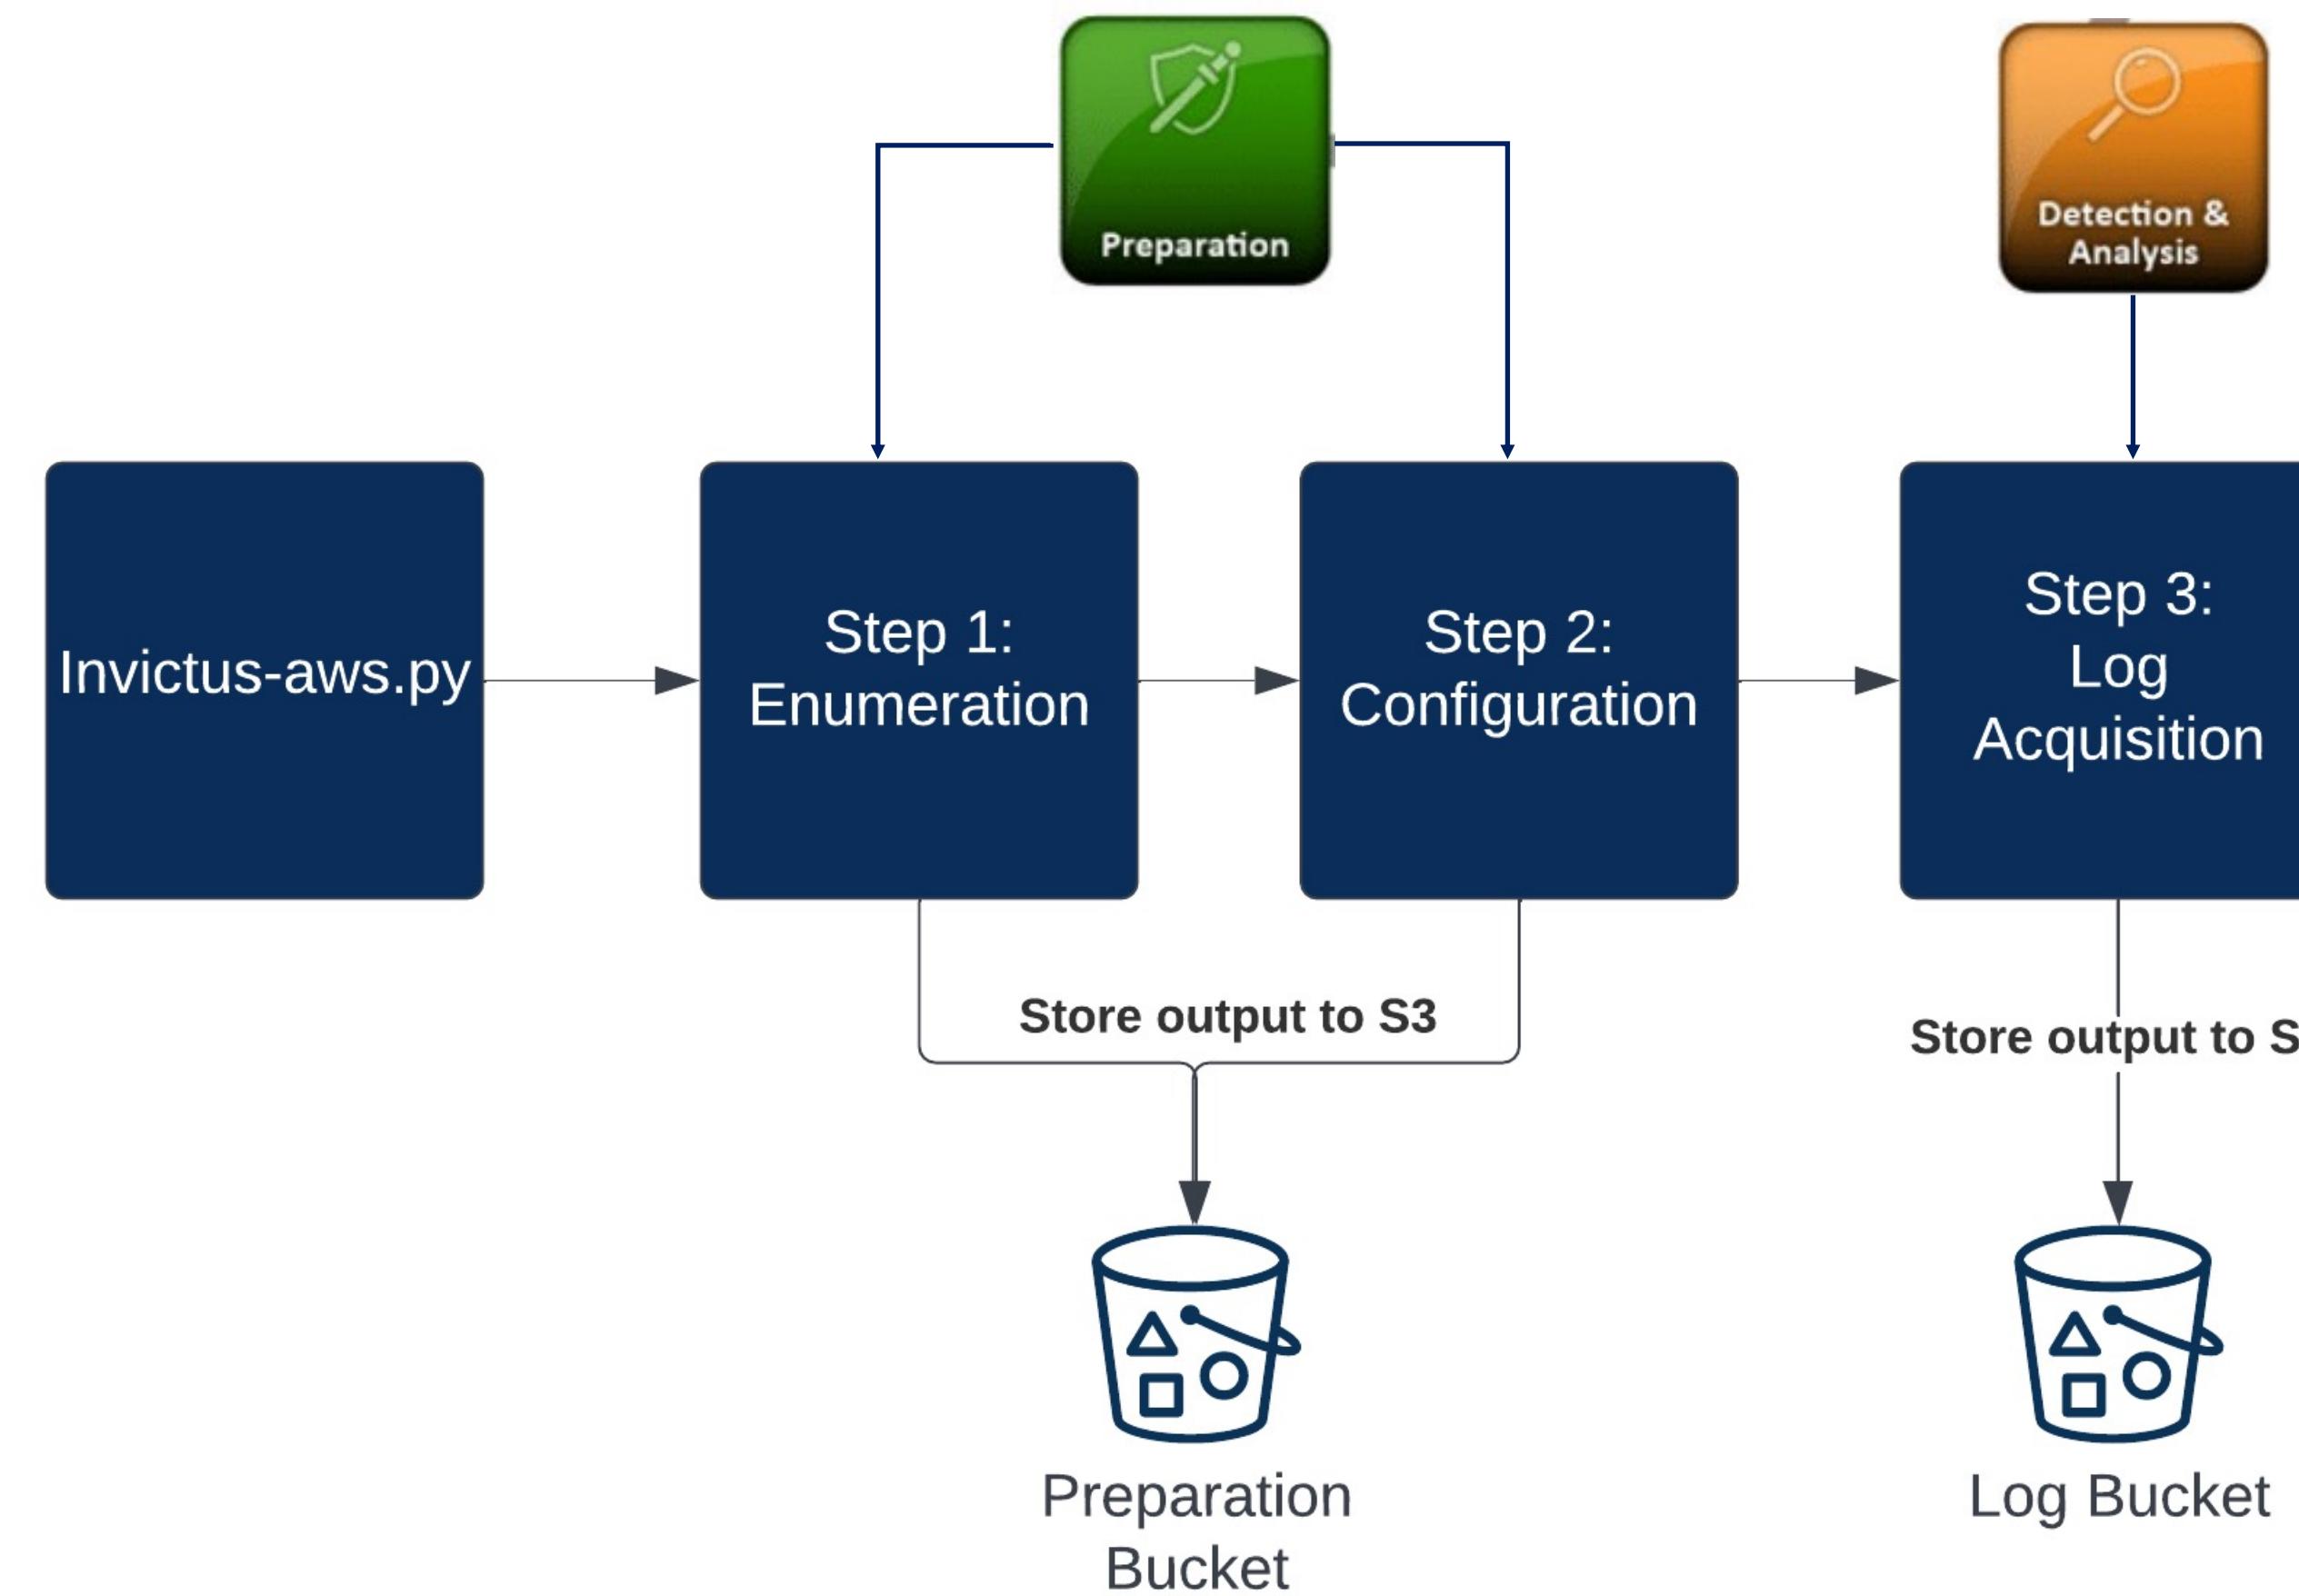

The screenshot shows the GitHub repository page for 'invictus-ir / Invictus-AWS'. The 'Code' tab is selected. At the top, it shows 'main' branch, 1 branch, 0 tags, and a green 'Code' button. Below that is a list of commits:

Author	Commit Message	Date
invictus-ir	Update README.md ...	fea6896 10 seconds ago
	LICENSE	Initial commit
	README.md	Update README.md
	invictus-aws.py	Initial commit

Invictus-AWS Features

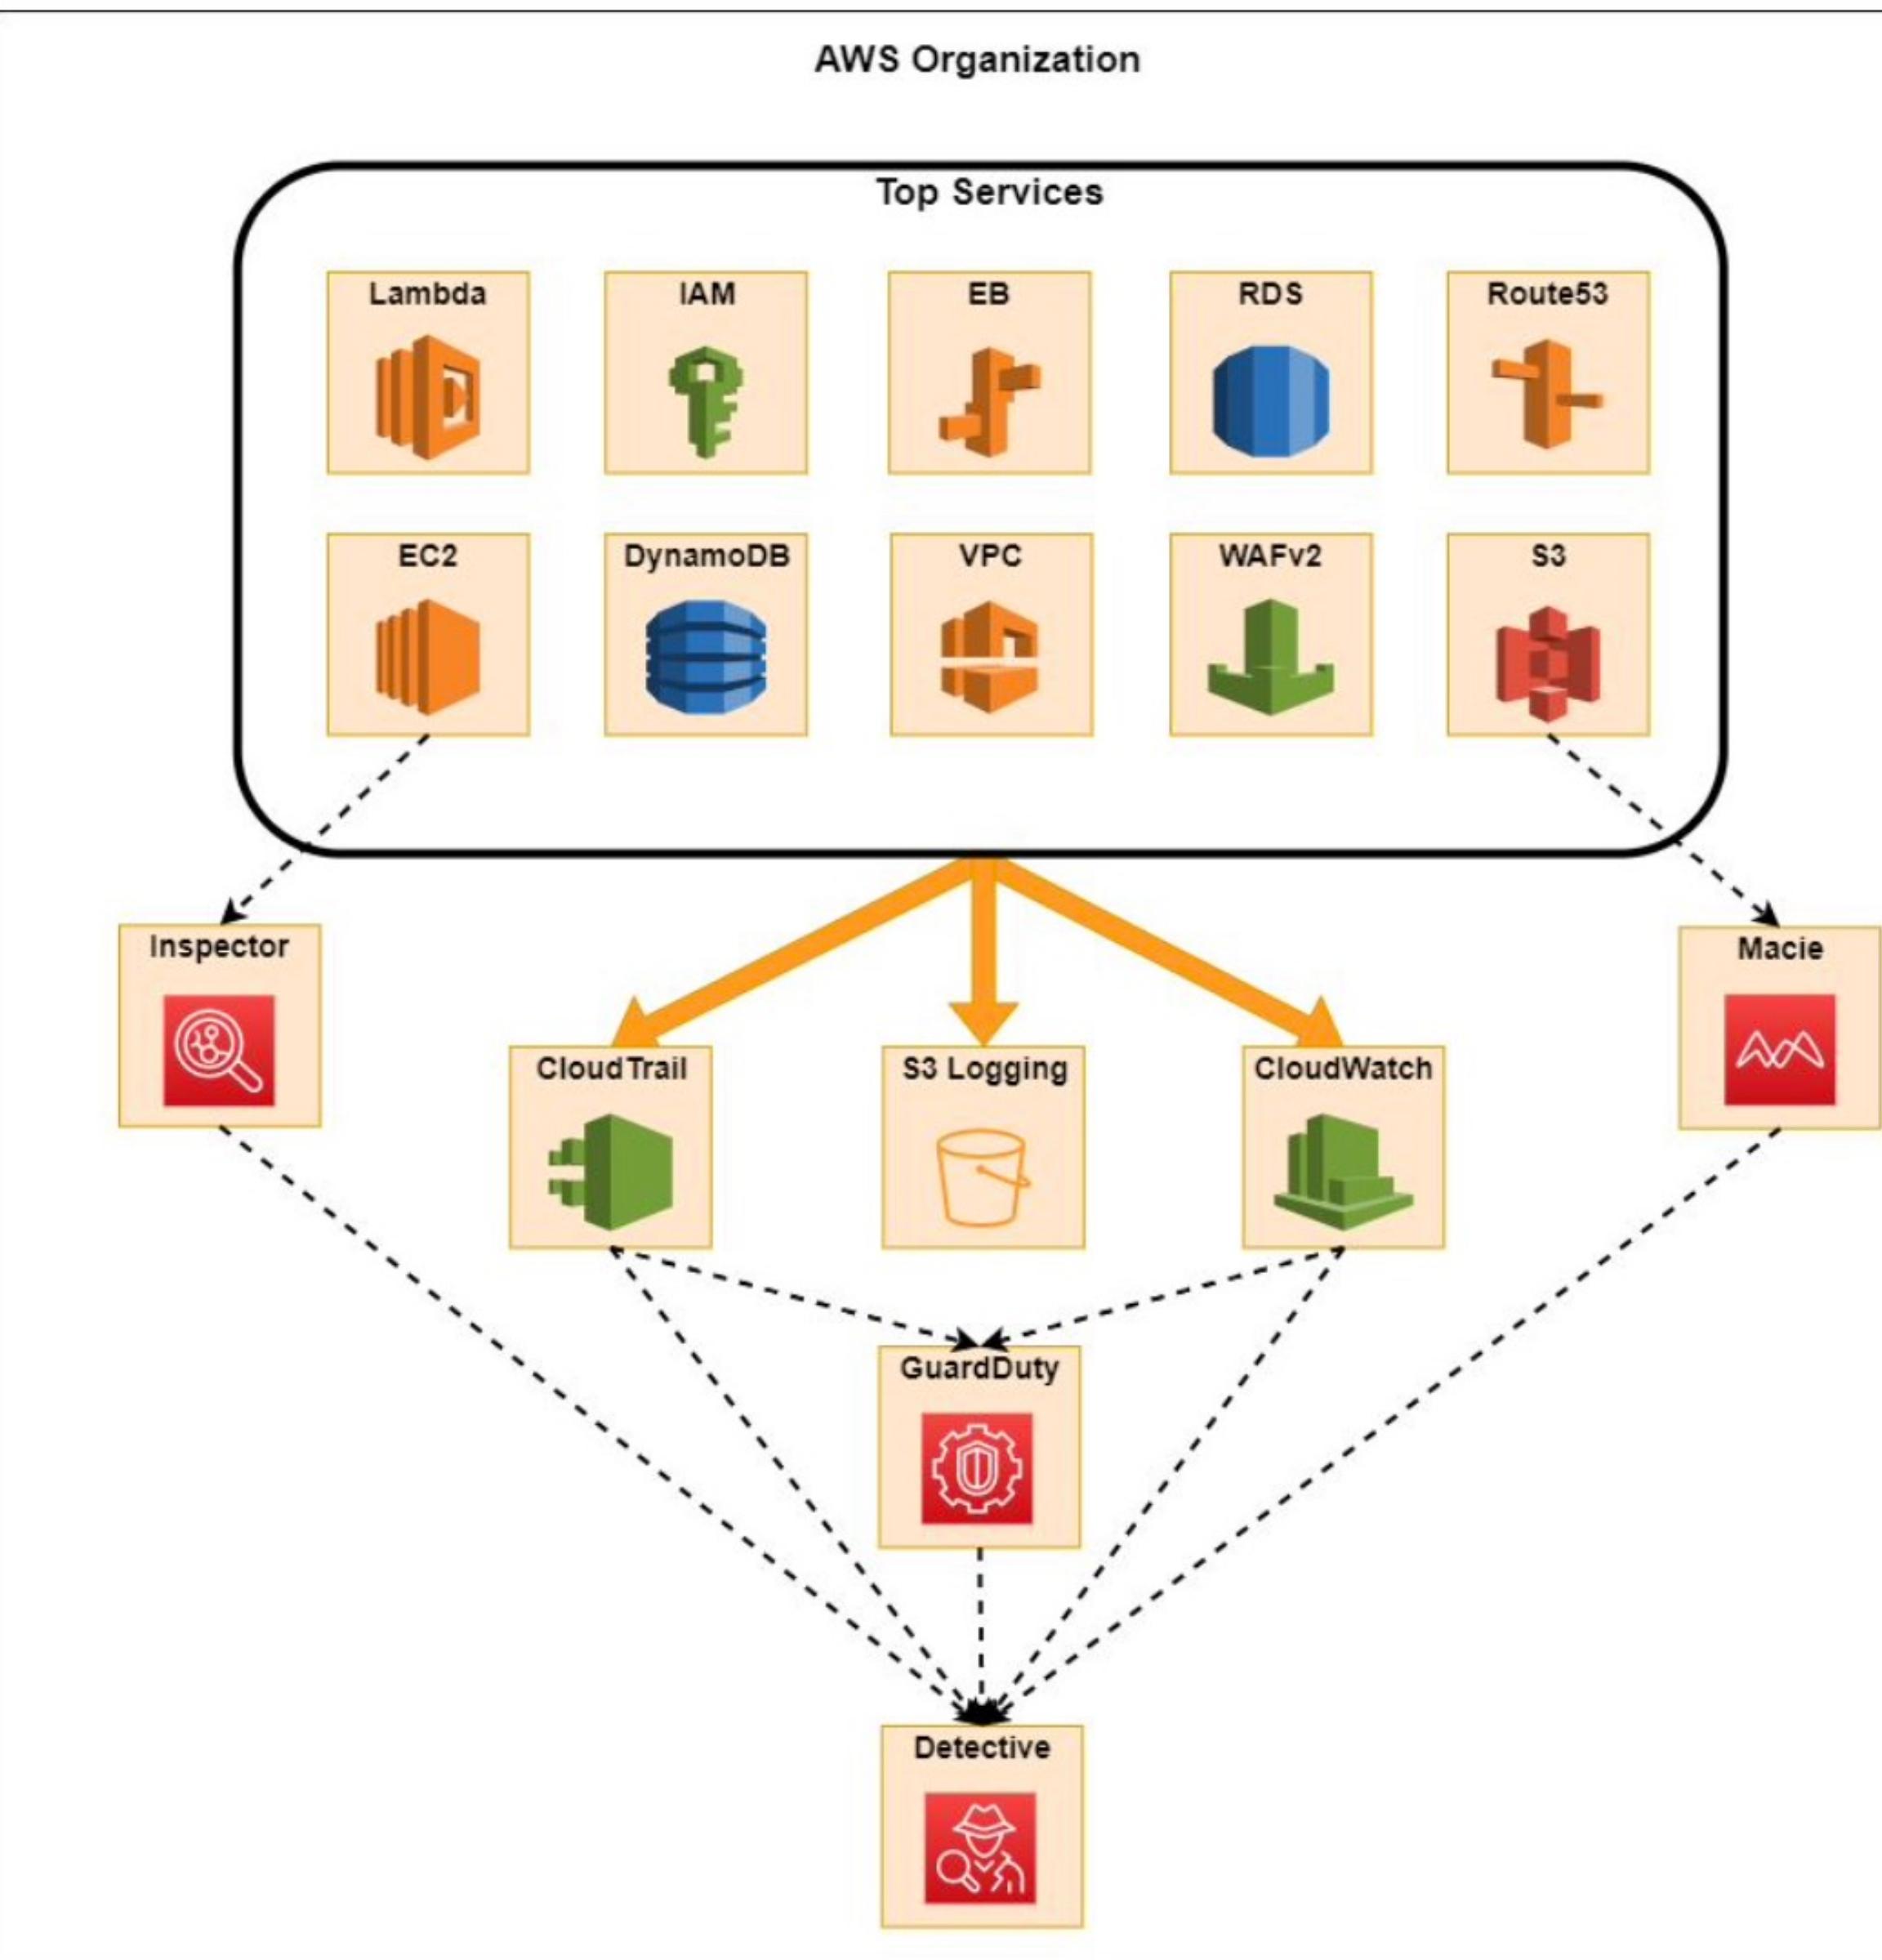

In... AWS

The script collects:

- ✓ EC2
- ✓ S3 storage
- ✓ VPC
- ✓ IAM
- ✓ Lambda
- ✓ Elastic Beanstalk
- ✓ Relational Database
- ✓ Web Application
- ✓ Route53
- ✓ Dynamo DB

Premium services

- ✓ CloudTrail*
- ✓ Inspector
- ✓ CloudWatch
- ✓ GuardDuty
- ✓ Detective
- ✓ Macie
- ✓ S3 Access Logging

Premium services.

*CloudTrail is on by default, the rest is not

Invictus-AWS

Phase 1 - Preparation

Enumeration

- Verify which services are available
- Use AWS commands that involve “list” and “describe”
- Export the results for all services in one JSON file

```
def enumerate_s3(self):  
    s3 = boto3.client('s3')  
    response = s3.list_buckets()  
    response.pop('ResponseMetadata')  
    buckets = fix_json(response)
```

Configuration

- For each available service, extract its configuration
- Use commands that involve “get”, “describe” and “list”
- Export the results per service in a JSON file

```
def get_configuration_s3(self):  
    s3 = boto3.client('s3')  
  
    response = s3.list_buckets()  
    response.pop('ResponseMetadata')  
    buckets = fix_json(response)  
    buckets = buckets['Buckets']  
  
    objects = {}  
    buckets_logging = {}  
    buckets_policy = {}  
    buckets_acl = {}  
    buckets_location = {}  
    for bucket in buckets:  
        objects[bucket['Name']] = {  
            'Logging': buckets_logging,  
            'Policy': buckets_policy,  
            'ACL': buckets_acl,  
            'Location': buckets_location,  
            'Objects': objects}
```

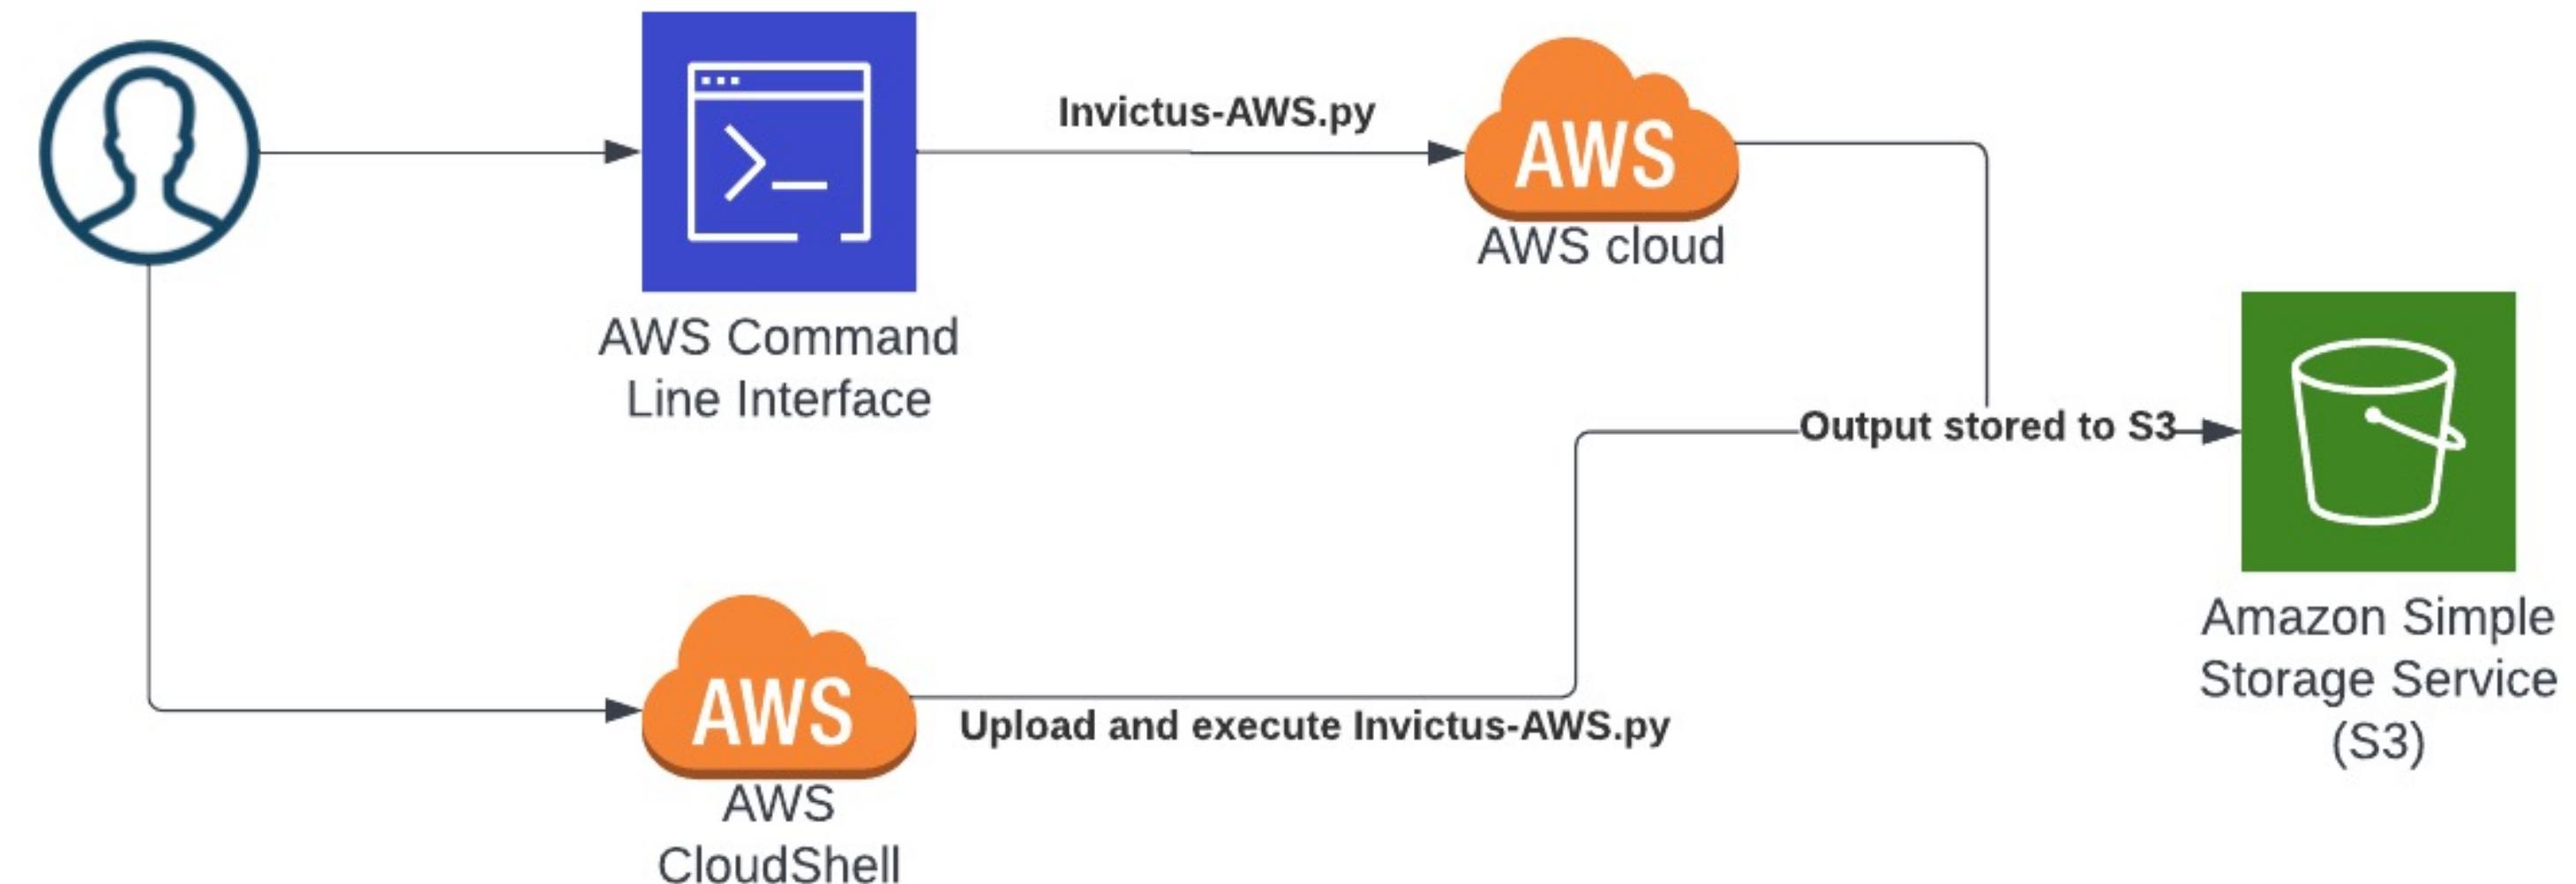

Invictus-AWS

Phase 2 – Detection & Analysis

Log extraction

- Extract logs from:
- CloudTrail, CloudWatch, S3 buckets
- Other sources (EC2, RDS, EB system logs)
- Store the results in an S3 bucket

Script can be executed using AWS CLI or
AWS CloudShell

Invictus-AWS Setup

Prerequisites

1. Access to AWS environment with sufficient permissions

Permissions determine the resources you can access. The script is ‘region fixed’ so it will **only** enumerate the services in the specified region.

2. Configure the script

✓ You **only** have to specify the region (e.g. eu-west-1)

3. Run the script:

- AWS Cloudshell, run it directly in AWS cloud

or

- AWS CLI, run it locally

Invictus-AWS

AWS CLI

1. Install Boto3 to run AWS commands

```
$pip3 install boto3
```

2. Configure AWS account

```
$aws configure
```

Note: This requires the AWS Access Key ID for the account you use to run the script.

3. Execute script

```
$python3 invictus-aws.py --region=<insert AWS region>
```

Invictus-AWS

AWS CloudShell

Step 1 – Upload script to CloudShell

The screenshot shows the AWS CloudShell interface. On the left is a terminal window titled 'AWS CloudShell' with the region 'eu-west-1' selected. The terminal prompt is '[cloudshell-user@ip-10-0-183-237 ~]\$'. On the right is a context menu titled 'Actions ▾' with the following options:

- Tabs layout
 - New tab
 - Split into rows
 - Split into columns
- Files
 - Download file
 - Upload file
- Restart AWS CloudShell
- Delete AWS CloudShell home directory

Step 2 – Run script in CloudShell

\$**python3 invictus-aws.py --region=<insert AWS region>**

Step 3 – Output is stored in S3 buckets

Name	AWS Region	Access	Creation date
invictus-aws-2022-04-12-psv7a	EU (Ireland) eu-west-1	Objects can be public	April 12, 2022, 08:53:19 (UTC+02:00)
invictus-aws-2022-04-11-yeyya	EU (Ireland) eu-west-1	Objects can be public	April 11, 2022, 11:12:03 (UTC+02:00)
invictus-aws-2022-04-11-3q6xr	EU (Ireland) eu-west-1	Objects can be public	April 11, 2022, 11:03:25 (UTC+02:00)
invictus-aws-2022-04-11-qruwk	EU (Ireland) eu-west-1	Objects can be public	April 11, 2022, 10:13:12 (UTC+02:00)
invictus-aws-2022-04-07-hcyro	EU (Ireland) eu-west-1	Objects can be public	April 7, 2022, 17:01:51 (UTC+02:00)

4 Analysis Overview

Use Splunk

Alternative, use your own tools

- Retrieve logs from S3 buckets
- Parse .json files and analyze .json files in your preferred tool

4 Analysis

Automated retrieval

More settings

Interval

Interval

Number of seconds to wait before running the command again, or a valid cron schedule. (leave empty to run this script once)

Source type

Set sourcetype field for all events from this source.

Set sourcetype

Manual

Set to automatic and Splunk will classify and assign sourcetype automatically. Unknown sourcetypes will be given a placeholder name.

Source type *

_json

If this field is left blank, the default value will be used for the source type.

4 Analysis Conclusion

The future What is next?

Add additional services

Not all services are supported, extend the tool to support additional services.

Interface with other tools

It would be great to extend Invictus-AWS to other tools to cover more of the IR lifecycle. For example, collecting snapshots and memory from an AWS instance

Extract more logging

The dream is to built a tool, that can automatically identify all possibly relevant logging in an AWS environment with the ability to extract everything.

Support AWS global collection

The tool currently only works in a certain region this is because some of the sub commands for enumeration and configuration require region information. Further research is required to identify whether it's possible to modify the script so it can be run globally instead of per region.
